Dear Recruiter,

The world of software development has always caught my attention, in fact, since very young I have been developing and building stuff with basic programming such as Arduino and "playing around" with IoT devices.

For this reason, I have studied ICT Systems Engineering in Manresa, and we have dived very deep into the software branch. Consequently, I have a robust knowledge of software design, programming, and knowledge of operating systems, relational databases, and network administration.

Due to my special attention and interest in the world of Artificial Intelligence and Machine Learning, I conducted a research study for the final degree project (TFG) to obtain predictive models for university enrollments, analysing the academic history of each student (anonymised), and predicting their future registrations with the objective to optimise and estimate the faculty hours to be hired.

Lastly, I've had the opportunity to collaborate on a European consortium project, researching Federated Learning solutions (a very interesting branch of the AI/ML field) and building an API integrating the VEDLIoT (Very Efficient Deep Learning in IoT) toolchain.

Hence, through my experience, I have gained a strong interest in the software/research field with the following skills:

- Robust knowledge of software design, programming, and operating systems.

- Capability to accomplish task autonomously.

- Ability to work in a team and collaborate with others, helping and learning from each other.

- Experienced in privacy-preserving ML and software technologies.

- Strong interest in researching in the AI/ML field.

At Deloitte, I've been able to deliver high-quality solutions to clients. I lead the implementation of new features, ensuring they meet client needs within the specified deadlines. Moreover, I've successfully managed complex technical challenges and debugged production issues, ensuring error-free client operations.

To sum up, my primary objective is to start in a technical role to establish a strong foundation. In the future, I would like to progress into a position that I always dreamt, which involves working in a R&D position conducting and leading exciting projects across the software and research fields.

Sincerely,
Anass Anhari
